

PREFAC WHY HIS BOOK

LIST OF FIGURES

xviii

CHAP ER ONE: INTRODUCTION

1.1.1 Example

1.2. What Is a Resource?	4
1.3. Resource Allocation Policy	6
1.4. Likelihoods and Statistics	6
1.5. Performance Measures	
1.6. An Example (Revisited)	
1.7. The Two Fundamental Approaches to Achieving Desirable Performance	
1.8. Layered Models of Computer and Communication Systems	
1.9. Layers and Performance	
1.10. An Application Program Development View	
1.11. Local Area Network Interfaces	
1.12. A Communications System Example	
1.13. Operating System Performance	26
1.14. Processor Design	30
1.15. Text Outline	32
P	34

CHAP ER TWO: CONCURRENCY AND PARALLELISM

42

2.1. General Approaches	
2.2. An Example: Printing Ten Jobs	44
2.3. A More General Example	52
2.4. Preemptive vs Nonpreemptive Scheduling	56
2.5. Impact of Partial Ordering and Fluctuation	
2.6. Polynomial Evaluation	
2.7. Critical Path Scheduling	
2.8. P Identical Parallel Processors	
2.9. Single Processor Deadline Scheduling	
2.10. Pipelining	
2.11. Bounding the Makespan for Pipeline:	
2.12. Johnson's Rule	74
2.13. S Stage Pipeline	75
2.14. General Problem Classification	76

xiii

2.15.A Packet Switching System	82
Problems	85
CHAPTER THREE: DATA ANALYSIS AND SIMULATION	93
3.1.Methodology	93
3.2.Statistics	94
3.3.Measurement Criteria	99
3.4.An Example: Report Generation on Two Printers	100
3.5.Modeling	103
3.6.An Illustrative Example: Directory Assistance Operator Work Times	105
3.7.Measurement Tools	
3.8.Data Analysis and Interpretation	113
3.9.Simulation	114
3.10.The Structure and Mechanics of Simulation	116
3.11.Simulation of Link Level Flow Control	119
Problems	126
CHAPTER FOUR: MEAN VALUE ANALYSIS	140
4.1.Little's Law	140
4.2.Scheduling a Single Processor to Minimize the Mean Flow Time	148
4.3.Telephone Traffic Engineering	149
4.4.Serially Reusable versus Concurrently Shared Resources	150
4.5.Packet Computer Communications Network	154
4.6.A Model of a Processor and Disk System	155
4.7.Mean Throughput/Mean Delay Bounds for Single Class Networks	162
4.8.Mean Throughput Rate Upper Bound for Multiple Class Networks	167
4.9.Voice Message Mail and Electronic Mail Storage System	168
4.10.Multiple Processor/Multiple Memory Systems	170
4.11.Transaction Processing System	173
4.12.A Distributed Data Communications System	176
4.13.Different Data Structures for Multiple Processors/Multiple Memories	181
4.14.Two Types of Jobs	184
4.15.Multiple Class Multiple Resource Mean Value Analysis	185
Problems	188
CHAPTER FIVE: OFFICE COMMUNICATIONS	206
5.1.Why Offices?	206
5.2.Telephone Tag	206

5.3.Copying and Reproduction	211
5.4.Document Preparation	215
5.5.Local Area Networks	220
5.6.Professional Work Station Productivity Gains	223
5.7.Interactions of Secretaries and Managers	228
5.8.An Office System Model	233
Problems	243

CHAPTER SIX: JACKSON NETWORK ANALYSIS

6.1.Overview	254
6.2.A Single Node with P Parallel Processors	255
6.3.Asymptotics	269
6.4.Teletraffic Engineering of an Automatic Call Distributor	275
6.5.Pooling Resources	279
6.6.General Single Class Jackson Network Model	281
6.7.Pipeline Processing	286
6.8.One Processor, One Paging Drum, One Moving Head Disk	290
6.9.Prototype Directory Assistance System Case Study	291
6.10.Multiple Class Jackson Network Model	293
6.11.Mean Throughput Rate Bounds for Product Form Distributions	297
Problems	301

CHAPTER SEVEN: JACKSON NETWORKS: APPLICATIONS I 311

7.1.Flow Control over a Single Virtual Circuit on a Single Physical link	311
7.2.Packet Switching Communication Network Analysis	324
7.3.Engineering Alternate Routing Trunk Groups	328
7.4.Data Communication Network Design	330
7.5.A Circuit Switching System	336
7.6.Digital Circuit Switching	350
Problems	362

CHAPTER EIGHT: JACKSON NETWORKS: APPLICATIONS II

8.1.Private Branch Exchange Engineering	368
8.2.A Data Packet Switching Node	374
8.3Automatic Call Distributor with Customer Defection	386
8.4.Hierarchical Analysis	390
8.5.On Line Transaction Processing	398
Problems	414

CHAPTER NINE PRIORITY SCHEDULING	423
9.1. Time Scale of Interest	424
9.2. Workload Arrival Statistics	424
9.3. Service Time Distribution	430
9.4. Resource Allocation Policy	438
9.5. Measures of Congestion	439
9.6. Approximation of the Inverse of a Laplace Transform	440
9.7. Kendall's Queueing System Notation	444
9.8. Single Server Queue with Poisson Arrivals and General Service times	445
9.9. The FS/G/1 Queue with Service in Order of Arrival	452
9.10. The M/G/1 Last Come First Serve Queue	453
9.11. The M/G/1 Queue with Intervisits	456
9.12. Synchronous Data Link Control	461
	467
CHAPTER TEN PRIORITY SCHEDULING II	
10 Examples	473
10.2. The CP/G/1 Queue with Static Priority Arbitration	475
10.3. Analysis of CP/G/1 Queue with Static Priority Arbitration	481
10.4. Packet Switch Delay Analysis	492
10.5. The M/G/1 Queue with Processor Sharing	494
10.6. Comparisons of Scheduling Policies with Fixed Workloads	496
10.7. Optimum Scheduling Policies	499
10.8. Controlling Overload	502
10.9. Multiplexing Voice and Data over a Single Digital Link	506
10.10. Flow Control of a Single Virtual Circuit	
Problems	
CHAPTER ELEVEN LOCAL AREA NETWORKS	
1. Traffic Handling Characteristics	
2. Local Area Network Topology	534
3. Bus or Broadcast Medium Model	
4. Token Passing Access via a Bus	538
5. Token Passing Mean Value Analysis	540
6. Exhaustive Polling of Two Queues	545
7. Carrier Sense Collision Detection Access	555
8. Carrier Sense Access Loss Model Analysis	558
9. Slotted P-Persistent Carrier Sense Access	562

TABLE OF CONTENTS

xvii

11.10.Reservation Decision Tree Bus Access	571
11.11.Token Passing Access via a Ring	578
11.12.Comparisons	579
Problems	583
